

Installation characteristics:

- Kliux Geo 4k hybrid system.
- Mini aero-generator with 4 kWh + 3,3 kW.
- Photovoltaic panels located on the roof of the Golf Club House.
- Electronic panel located in the basement for charging the buggies.

Installation proposal:

- Energy self-sufficient for charging the buggies.
- Four main benefits provided by the Kliux VAWT to the users: reliable access to energetic resources, utility bill reduction, community and corporate positive image and advertising support.

This installation is in fact the first of its kind (first VAWT installation in a golf course), and relies on an innovative system to take advantage of wind power to obtain electricity, which is patented by Geolica Innovations, Kliux's R&D laboratory.

This particular installation is barely 5 yds. away from a marked trail of "Camino de Santiago".
